Supplementary Fig. 5. Proportion of Japanese patients who achieved an MCS response in induction studies A and B (A, B) at week 10, and in the maintenance study at week 58 (C). Error bars indicate 95% confidence intervals (CIs). CIs for 0-responder treatment arms are not presented. 95% CIs were calculated based on normal approximation with a continuity correction. MCS response was defined as a reduction of at least 3 points in MCS and at least 30% from induction baseline with an accompanying decrease in rectal bleeding subscore of at least 1 point, or an absolute rectal bleeding subscore of 0 or 1. MCS, Mayo Clinic score.
